This project entitled as "Pharmacy Management System" will help to make the new stock stored process of Medicine easier. Now-a days, it is difficult to keep track the status of different types of medicines in the present scenario in the stock house. In this project we computerize this part of stock management process of medicine, so that it is easy to keep track the status of medicine. The "Pharmacy Management System" is a web-based program aimed to make easier and more convenient way for the stock managing process. The purpose of implementing this project is to understand the data modeling concepts that is used in a real time scenario and to implement a fully functional database system which interacts with a front end interface. The system is developed with a front-end web interface coded using PHP and a back-end database MySQL.
